Abs Jour: Ref Zhur-Biol., No 20, 1958, 90993

G-1

Abstract: Acanthocerhalus anguillae) and crustaceans (*Caligus lacustris*) were found. In regard to its zoogeography the Lake Ladoga Parasitofauna bears a mixed character: paleoarctic species comprise 44.7% (41 species), representatives of the Arctic Sea group - 24.5% (23), the Ponto-Caspian group - 17% (16); parasites of the Atlantic Ocean, brackish-water, sea and relict groups were also represented. The Ponto-Caspian forms are represented chiefly by monogenetic trematodes, the Arctic Sea forms by cestodes and crayfish. Analysis of the parasitofauna of the lake's relict fish confirmed the conclusion of V. A. Dogel that the relicts lose their specific parasites completely or partially and acquire a certain number of non-specific forms.

Abs Jour: Ref Zhur-Biol., No 20, 1958, 91006

Abstract: by the cestode *Proteocephalus exiguum* grows noticeably weaker. *Echinorhynchus salmonis* and hematode *Cystidicols farionis* contaminations increase sharply, whereby the cestode *Cyathocephalus truncatus* appears. These shifts in the forms are connected with the whitefish's changes in feeding habits. It feeds on plankton crawfish and Tendipedidae larvae for the most part during the early years of its life, and later on feeds on back-swimmers. Seasonal changes in the parasitic fauna which have been traced to the second half of the year are weakly expressed in mature whitefish. The pathogenicity of *E. salmonis* which injures the mucous membrane in the lower section of the whitefish's intestine has been demonstrated. -- M. Ye. Morozova

Title : Parasitic Fauna of the Young of Salmon (Salmosalar) During Early Stages of Its Development.

Orig Pub : Tr.Leningr.o-va yestestvoispyt. 1957, 73, No.4, 159-163

Abstract : The parasitic fauna of the young of salmon (from 2-3½ months, from 27-41 mm long) bred in floating nurseries in the river Narva near the areas of the natural spawning grounds of the salmon, was investigated. Autopsies were performed, beginning from the 10th day following the stocking of the young fish in the nurseries for a period of 2 months and 1 days. 9 species of parasites were registered, viz., Trichodina megamicronucleata, Ichthyophthirius multifiliis, Chilodonella cyprini, Gyrodactylus sp., Bucephalus polymorphys, Diplostomulum

spathaccum, Argulus foliaceus and glochidia of Anodonta sp. and Unio sp. The number of parasitic species and the intensity of invasion by various species increases markedly with the age of the young fish. In the 2-months-old young only Trichodina, glochidia of Anodonta and crawfish were found. In 2½ months-old young I. multifiliis, D. spathaceum and glochidia Unio are added to that list. The young fish at the age of 3-3½ months already have the whole described collection of parasites.--I. B. Raykov

SOURCE: Byulleten' izobretenij i tovarnykh znakov, no. 13, 1965, 119

TOPIC TAGS: concrete, concrete mixer, mechanical motion instrument, construction machinery

ABSTRACT: This Author Certificate presents the working unit of a forced-action concrete mixer with an immobile container and a centrally located mixing mechanism (see Fig. 1 on the Enclosure). The mixer contains a guide bar carrying a hinged bracket with a scraper blade and a returning spring. To maintain a constant angle between the scraper blades and the mixed material, the scraper blade is fixed to the bracket and is connected to the guide bar by a rigid connecting rod. Orig. art. has: 1 figure.

ABSTRACT : The concentrative depolarization of fluorescence and phosphorescence of acridine yellow (I) in boric acid at room temperature was studied. The degree of anisotropy of phosphorescence with the growth of concentration of I decreases more rapidly than the anisotropy of fluorescence, which is ascribed to the excitation energy transfer from the molecule of I in the metastable state. Quantitatively, this

the absorption becomes equal to the absorption of the investigated solution for a given  $\lambda$ , and the absorption in both pure solvents as well as the intensity of the light leaving the monochromator. In the second position of the photomultiplier one measures the fluorescence of the investigated in standard solutions. A method is given for calculating the corrections that take into account the reabsorption, on the basis of measurement data in the first position of the photomultiplier. Also considered are corrections for scattering and corrections caused by the different degree of polarization of the fluorescence in both solutions.

TITLE: Hydrogen and helium indicator and leak detector

SOURCE: Elektrotechnicky obzor, v. 55, no. 2, 1966, 86-90

TOPIC TAGS: chemical laboratory apparatus, hydrogen, helium, gas analyzer

ABSTRACT: The article describes an instrument which permits both continuous analysis of the atmosphere and the detection of leakage of equipment in operation, as well as control of individual parts during manufacture and assembly. In its function as analyzer, the sensitivity of the indicator amounts to 5% of the total deviation per 0.1% by volume of H<sub>2</sub> in the atmosphere in the working range from 0 to 4%; in its function as detector, the instruments permit ascertaining a leak through which hydrogen flows at a minimum rate of 10<sup>-4</sup> torr x 1/sec. of Candida albicans Berkhoult

SOURCE: Chemické zvesti, no. 1, 1965, 21-27

TOPIC TAGS: polysaccharide, biochemistry, yeast, plant chemistry

ABSTRACT: [Authors' English summary modified]: From the surface of cellular membranes of pathogenous yeast Candida albicans Berkhoult Strain 109, a water-soluble polysaccharide with a degree of polymerization of 36 and a specific rotation  $[\alpha]_D = +56^\circ$  was isolated. Methylesters of D-mannose found in the substance are described; glycerol is the only alcohol found in products of hydrolysis. It was found by means of acid hydrolysis that the mannite has alpha-glycosidic bonds. The investigated substance is.

TITLE: Separation of O-trimethyl-silyl derivatives and O-methyl derivatives of mono-saccharides by gas-liquid chromatography 1, 44.55

SOURCE: Chemicke zvesti, no. 1, 1965, 28-33

TOPIC TAGS: carbohydrate, biochemistry, gas chromatography, chemical separation, organosilicon compound

ABSTRACT: The authors describe separation of O-trimethyl silyl derivatives from O-methyl derivatives of monosaccharides by means of gas chromatography. The anchored phase used was a polyester of 1,4-butane diol succinate. They found that elution periods of methyl analogues of trimethyl silyl ethers were a function of the anchored phase and its carrier (silica). Eng. A. Kardosova and P. Suchansky collaborated in the work in the division of gas chromatography. Orig. art. has: 4 graphs, 1 table. [JPRS] Card 1/2

TITLE: Some derivatives of diethylmercaptal 2,3:4,5-di-O-isopropylidene-D-galactose

SOURCE: Chemické svesti, no. 11, 1965, 860-863

TOPIC TAGS: nonmetallic organic derivative, chemical synthesis, chromatography, condensation reaction

ABSTRACT: Preparation of diethylmercaptal 6-O-methyl-2,3:4,5-di-O-isopropylidene-D-galactose, diethylmercaptal 6-O-methyl-D-galactose, diethylmercaptal 6-O-acetyl-2,3:4,5-di-O-isopropylidene-D-galactose, and diethylmercaptal 6-O-triphenylmethyl-2,3:4,5-di-O-isopropylidene-D-galactose is described. The starting product for their preparation was diethylmercaptal of the 2,3:4,5 -di-O-isopropylidene-D-galactose, which was prepared by chromatography from the condensation product of diethylmercaptal of D-galactose and acetone in the presence of sulfuric acid. The elementary analysis was performed in the Analytical Section of the Chemical Institute under the direction of Engineer C. Peciar. (JPRS)

TITLE: Technological and design advantages of LKP-400 type press for stamping

PERIODICAL: Referativnyy zhurnal, Tekhnologiya mashinostroyeniya, no. 2, 1963, 17, abstract 2V100 (Chekhosl. tyazhelaya prom-st', no. 7, 1962, 26-30)

TEXT: For cold extrusion of steel parts in mass production the 400t LKP-400 press (CSSR) has been designed giving the possibility of working with the rated force on a considerable section of the stroke which makes it possible in one operation to produce parts which on other presses are stamped in 2 operations. The number of strokes is 20/min which at a 50% utilization of the number of strokes enables one to produce about 600 parts per hour. The slide bar stroke is 40mm, the maximum height from the table to the slide bar is 900mm. The press is driven by an electric motor by means of a tex-rope drive on the flywheel mounted on the drawing-in shaft on which a multi-disc clutch and a brake are also arranged. From the drawing-in shaft the

Technological and design...

motion is transmitted to the intermediate shaft on which there is a shearing torsional-moment safeguard of the press. The intermediate shaft is connected by means of a gear drive with the eccentric shaft of the press. In the slide bar there is a overload safeguard responding to a 25% overload. The press has an electropneumatic control. The press is furnished with a pump for cooling the tool and with guide blocks controlling its own operation as well as that of devices automating the charging of blanks. The press has a cast built-up frame connected with stretching bolts. The press can operate on single and automatic strokes. The device for charging blanks and removing parts from the press can have an independent drive or be driven by the moving elements of the press. Examples of parts extruded on the press are given: a socket of 75mm external diameter, a ball end with a 62mm ball and various piston pins. There are 10 figures.

Title : Crystallographic Data on Dihydroxybenzoquinones.

Orig Pub : Sb. chekhosl. Khim. zabor, 1957, 22, No 5, 1620-1623

Abstract : Four preparations of 2,5-dihydroxy-1,4-benzoquinone (I) were examined crystallographically ( $\lambda$ -Cu-K $\alpha$ ), and by X-ray analysis. The materials were crystallized under various conditions, crystals (I) "red form" (II), three samples of 2,5-dimethylhydroxy-1,4-benzoquinone (III) and four samples of potassium salt of 2,5-dihydroxy-1,4-benzoquinone (IV). All four preparations of I are crystallographically identical, the variation in coloration, appearance and the crystal size are due to differences in the crystallization conditions. I is crystallized in monoclinic syngony, II is triclinic.

"Speech Rehabilitation Following Laryngectomy."

Zagreb, Lijecnicki Vjesnik, Vol 85, No 7, July 1963, pp 729-733.

Abstract: The author describes two procedures for restoring some measure of speech capability to persons whose larynx has been removed by operation. The first procedure, which he terms dynamic-biological, consists of an attempt to restore the anatomical relationships in the hypopharyngeal area so as to compensate at least in part for the rime glottidis mechanism and lasts two to three months. The second procedure, which he terms prosthetic-restitutional, is designed for the 15 to 20 percent of patients who cannot be helped through the other procedure and consists of laryngeal vibrators in the form of neckpieces or pipes (e.g., the devices of GUSSENBAUER, GLUCK, and TAPIE; the most modern being TICCHIONI's [affiliations not given] pipe).

Illustration of TICCHIONI's pipe, five references (Western and Yugoslav).

## ABSTRACT:

One of the ethylene hydrocarbons with a quaternary carbon (Refs 1,2), 2,2,5-trimethyl hexene-4 (II) synthesized by the authors already earlier, was obtained by the reaction of primary isoprene hydrobromide with tertiary butyl magnesium chloride (according to Grignard-Wuertz). This compound (II) was used for the synthesis of the difficultly accessible paraffins which have two quaternary carbons separated by two  $CH_2$  groups, i.e. of dineopentyl and its homologs (of the di-  
neoalkyls). Compound (II) was transformed by hydrogen chloride into the saturated tertiary chloride (III), which was caused

of the Synthesis of Dineoalkyls ( $C_{10}H_{22}$  -  $C_{12}H_{26}$ ),  
Dineopentyl and Its Homologs

to react with alkyl magnesium bromides in the presence of  $HgCl_2$  (Grignard-Wuertz reaction) and led to compound (IV) (Scheme 1). In the reaction of tertiary chloride (III) with alkyl magnesium bromides also side-reactions took place: the separation of HCl from the tertiary chloride (re-formation of the initial-2,2,5-trimethyl hexene-4(50%)), which was then reduced into the 2,2,5-trimethyl hexane (Scheme 2). This mixture of dineoalkyl and the lower boiling trimethyl hexene and trimethyl hexane which is obtained in any case was separated by fractional distillation. The dineoalkyls purified by a further distillation and by methods of chromatography on silica gel resulted in yields of 10-16%, computed for the tertiary chloride (III) used for the reaction. The Raman spectra confirm the presence of quaternary carbon atoms in them. By the method of the "Grignard-Wuertz reaction carried out two times" the authors synthesized the difficultly accessible dineopentyl (2,2,5,5-tetramethyl hexane) and its homologs
